

PostgreSql Replication vs Citus Data

What is PostgreSQL Replication?

With replication, a queryable copy of the live database is created. By running the queries for reporting purposes on this read-only server, the load on the master server is reduced.

What is Citus Data?

Citus is an open source extension of Postgres that distributes data and queries among multiple nodes in a cluster.

| Features | Citus Data | PostgreSql Replication |
|---------------------------|--|--|
| Open Source | yes | yes |
| Master-Slave Architecture | no | yes |
| Speed for Insert (1 row) | 36,071 ms | 30,640 ms |
| Speed for Select (1 row) | 2,098 ms | 11,757 ms |
| Installed with | docker | docker |
| Establishment | 2010 | 2006 |
| Last Version | 10.1 | 13 |
| primary database model | Relational DBMS | Relational DBMS |
| Secondary database models | document store | document store Spatial DBMS |
